Lesser Crested Tern: Abundant winter visitor

The Lesser Crested Tern (Thalasseus leucophaeus) was also known as the Sooty Tern, and the Lesser Crested Tern is one of the abundant winter visitors to St. Lucia. It is a small tern, with a wingspan of about 30 inches, and it is easily identifiable by its white tail with a black tip. The Lesser Crested Tern is a graceful flyer, and its white underparts and black upperparts make it easy to distinguish from other terns. It is a social bird, often seen in small flocks, and it is often found near the shore, where it feeds on small fish and crustaceans.

The Lesser Crested Tern is a bird of the winter months, and it is often seen in large numbers in St. Lucia. It is a bird of the sea, and it is often seen fishing for small fish in the ocean. It is a bird of the salt marshes, and it is often seen foraging for food in the mudflats of the island. It is a bird of the winter months, and it is often seen in large numbers in St. Lucia.
